DE RUEDA CONSTRUCTION

HR EMPLOYEE LAYOUT

Agreed reference specification for Employee Management, onboarding, employee profiles, site transfers, employee IDs, archiving, permissions, and audit history.

Design direction

Professional construction ERP interface with a white workspace, dark navy sidebar, blue accents, clear typography, consistent spacing, searchable tables, and responsive desktop/mobile browser layouts. Keep the page aligned with the existing De Rueda Construction visual system.

Important: Included images are design references, not proof that these screens or workflows are already implemented in the live application.

1. Employee Management Dashboard

Provide HR with one central, searchable directory of active employees and quick access to each record.

• Search by permanent Employee ID, employee name, position, or assigned site.

• Filter by site, department/role, employment status, and other approved fields.

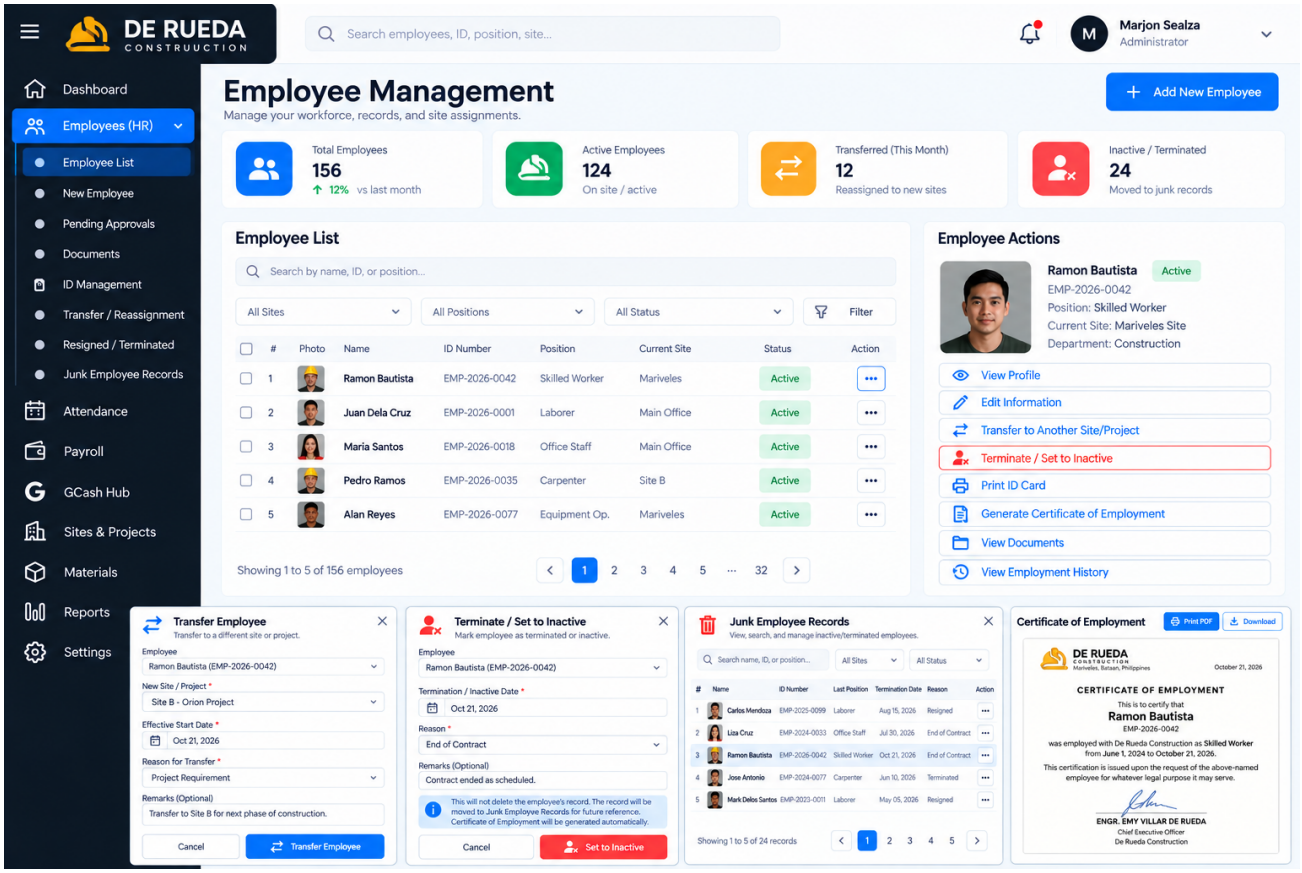

• Directory fields: employee photo where available, Employee ID, full name, position, assigned site, status, and available actions.

• Primary actions: New Employee / Onboarding, Open Profile, Edit, Transfer, Print Employee ID, Archive/Deactivate, and Restore where authorized.

• Show clear loading, empty, validation, success, failure, and permission-denied states.

• Do not display sensitive statutory or payroll data in the general directory.

HR dashboard reference

2. New Employees Onboarding

Keep onboarding as a clearly named tab or section within Employee Management. Guide HR through required fields and prevent accidental duplicate records.

• Search existing records before creating a new employee.

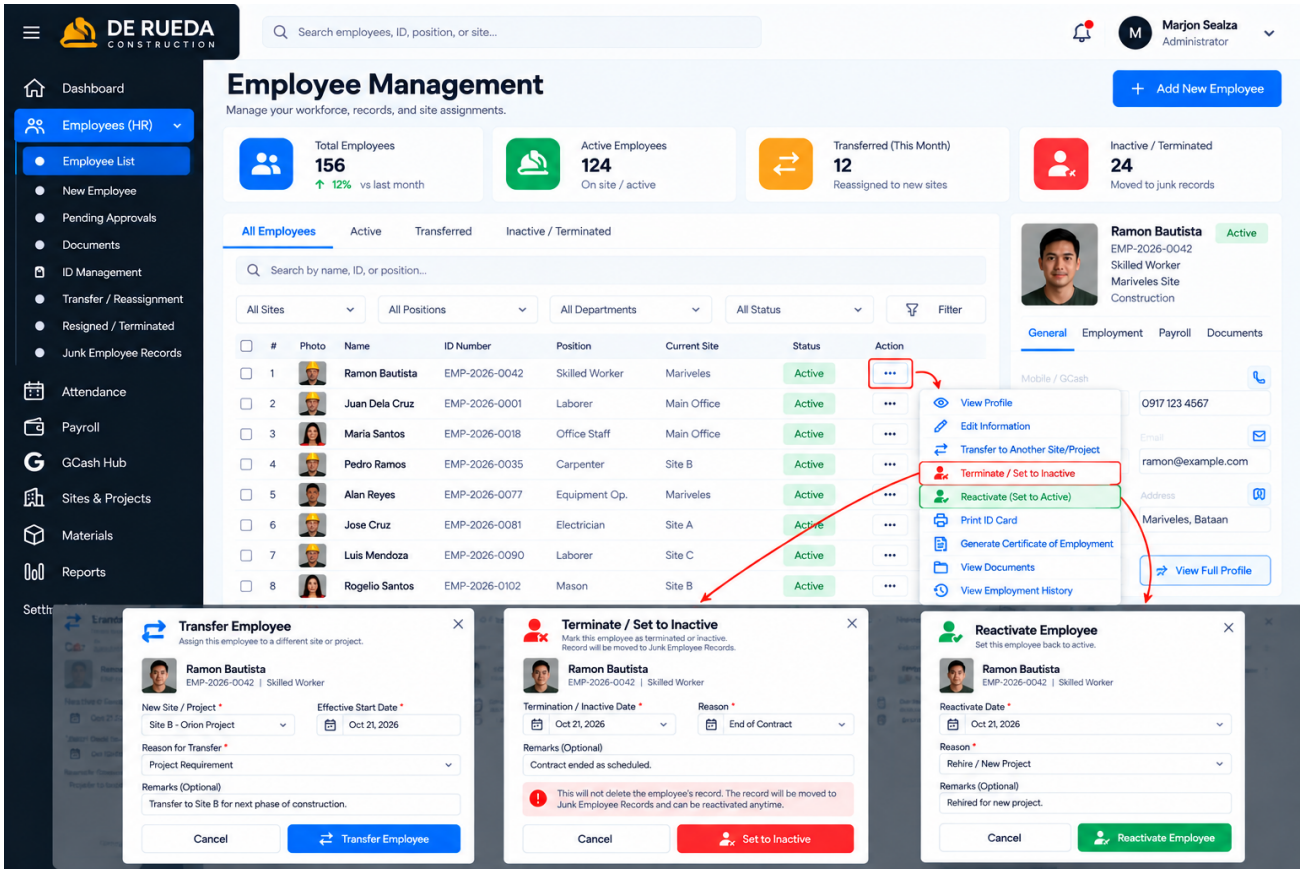

• Assign a permanent unique Employee ID. Employee names may repeat; Employee IDs may not.

• Capture approved personal/contact details, employment information, job title, employment type, start date, site assignment, supervisor, compensation basis, and required documents.

• Restrict SSS, PhilHealth, and other sensitive statutory information to authorized HR roles.

• Validate required fields before activation and clearly identify missing or invalid information.

• After saving, open the employee profile and record who created the record and when.

3. Employee Profile and Record Actions

The employee profile is the central place to review permitted employee information and navigate related records.

• Sections: Overview, Employment, Site Assignment & Transfer History, Attendance/DTR, Payroll/Payslips (permission-limited), Documents, and Activity History.

• Locate and edit records by Employee ID. Important changes should require a reason and keep before/after values in the audit history.

• Print an ID card using approved branding, employee photo, name, position, permanent ID, QR code, status, and site.

• Example ID format: DRC-EMP-2026-000001. Confirm this against the existing ID generator before implementation.

• Prefer archive/deactivation over permanent deletion so historical attendance, payroll, deductions, and documents are preserved.

4. Employee Transfers and Site History

A transfer changes the employee's current assignment without erasing the previous assignment or rewriting historical records.

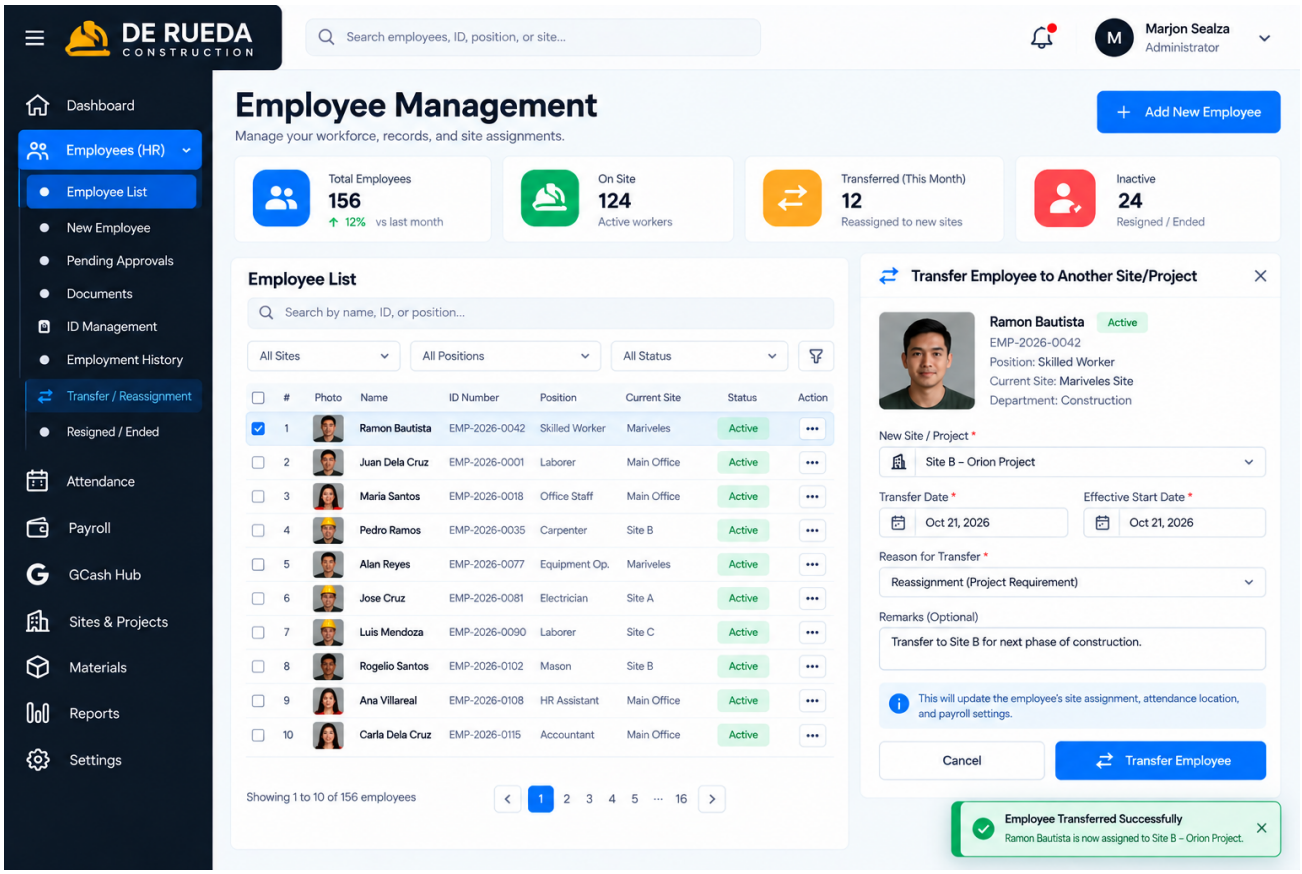

• Transfer form: employee ID/name, current site, destination site, effective date, reason, notes, and approving user where required.

• After confirmation, update the current assignment and create a dated history event with old site, new site, actor, timestamp, and reason.

• Do not change historical attendance or payroll site references when recording a transfer.

• Check permissions for source and destination sites and prevent transfers to unauthorized sites.

• Show a success confirmation only after the database change succeeds.

5. Employee ID Card and QR Rules

• Each employee has one permanent, unique internal Employee ID. Never reuse an ID after separation.

• The QR code should reference a safe internal identifier or authorized verification route, not expose private employee data in plain text.

• Printed ID fields: company branding, employee photo, name, position, Employee ID, QR code, status, and site if needed.

• Track reprints/replacements if required. A QR code must not be the only security control for sensitive HR access.

6. Archive, Restore, Permissions, and Audit

• Move inactive/separated employees out of the active directory into an authorized Archive/Junk Employee Records area.

• Restore/reactivation requires permission, status/site validation, and a recorded reason.

• Role permissions control who may view, create, edit, transfer, export, archive, restore, or access sensitive statutory/payroll information.

• Audit events should record actor, employee ID, action, timestamp, reason, outcome, and before/after values for sensitive changes.

• Never log passwords, OTPs, or secret credentials. Restrict and audit bulk employee-data exports.

7. Acceptance Checklist

■ Search and filters return correct records and respect the user's authorized scope.

■ Duplicate names are allowed; duplicate Employee IDs are rejected.

■ Onboarding validates required fields and records an audit event.

■ Important edits retain before/after values and the reason for the change.

■ Transfers update current site only after success and preserve assignment history and historical attendance/payroll references.

■ Archive/restore preserves records and checks permissions.

■ ID card and QR expose only approved information and the QR destination enforces access.

■ Unauthorized users cannot access SSS, PhilHealth, or restricted payroll fields.

■ Desktop and mobile browser layouts are usable, and every visible action works or is explicitly marked unavailable.

Implementation truthfulness

This PDF describes the intended HR/Employee layout and workflow. It does not certify that these features are already implemented. Verify the source code and test each acceptance item before release.
