DE RUEDA CONSTRUCTION

ERP Specification • New Salary Release Method

Purpose: replace the old homemade GCash QR and simulated batch-disbursement workflow with a site-managed, individually executed, auditable salary-release process.

1. Core Operating Rule

Each authorized Site Head uses their own personal GCash app on their own phone to send salary payments to employees individually. The ERP organizes the payroll release and records its status; it does not pretend to transfer money or claim a successful GCash transaction without evidence.

2. Salary Release Workflow

1. **Prepare payroll:** HR finalizes the payroll period, employee attendance, gross pay, deductions, and net pay.
2. **Approve the release:** an authorized approver confirms the payroll batch and the site responsible for payment.
3. **Open the site release queue:** the Site Head sees only the employees and amounts within their authorized site and payroll scope.
4. **Pay individually in GCash:** the Site Head opens their own GCash app and sends each employee's net salary using verified receiving details. The ERP must not request or store a GCash PIN, password, or OTP.
5. **Record the result:** the Site Head records the payment reference and attaches available proof. The system must not invent transaction IDs, receipts, or provider confirmations.
6. **Verify the payment:** an authorized reviewer checks the evidence and confirms or rejects the record. A receipt upload alone is not proof that payment succeeded.
7. **Issue the payslip:** after the payment is confirmed, the system may queue an SMS payslip to the employee's registered number, with duplicate-send protection.
8. **Reconcile:** HR and authorized management review paid, unpaid, rejected, and unresolved items before closing the payroll period.

3. Payment Statuses

AWAITING_PAYMENT — Payroll is approved, but payment has not yet been recorded.

RECEIPT_UPLOADED — Proof was submitted; this is not confirmation of payment.

UNDER_REVIEW — An authorized reviewer is checking the payment details.

PAID_VERIFIED — An authorized person confirmed the payment based on acceptable evidence.

PAYMENT_REJECTED — The submitted payment evidence was rejected; reason must be recorded.

NEEDS_REVIEW — The reference, amount, recipient, or payment result is inconsistent or unclear.

4. Employee Payment Profile

Use the employee's unique Employee ID as the primary record key. Store only the minimum receiving details needed for salary release, such as a verified GCash/mobile number and account-holder metadata where appropriate. Provide a correction and verification process for changed numbers. Never store GCash credentials, PINs, passwords, or OTPs. Restrict sensitive data to authorized roles and audit access or changes.

5. Site Scope and Permissions

- A Site Head can access only the sites and payroll releases assigned to them.
- HR can prepare payroll and manage employee/payroll records within its authorized scope.
- Only designated approvers may approve a salary release.
- Only authorized reviewers may mark a payment PAID_VERIFIED or PAYMENT_REJECTED.
- The CEO and explicitly authorized administrators may monitor cross-site summaries, subject to authentication and audit logging.
- Every approval, payment entry, evidence upload, verification, rejection, and correction must record the actor, timestamp, and reason where applicable.

6. SMS Payslip Rules

Queue an SMS payslip only after the payment reaches PAID_VERIFIED. Include the pay period, gross pay, deductions, net pay, payment amount, transaction reference if available, and payment status. Avoid sending duplicate payslips when a job is retried. Record the delivery attempt and result. If an SMS provider is not configured, show the item as pending/not configured rather than claiming it was sent.

7. Remove or Disable from the Old Workflow

- Homemade GCash QR codes presented as a payment mechanism.
- Fake or simulated one-click GCash batch payouts.
- Synthetic transaction IDs, fabricated receipts, and success statuses without provider evidence.
- Hardcoded wallet balances, merchant identities, and unsupported claims of live GCash API access.
- Any request for an employee's or Site Head's GCash PIN, password, or OTP.
- Production test controls that can fabricate payment events or mislead users about real money movement.

8. Controls and Acceptance Criteria

- No payment can be marked PAID_VERIFIED merely because a receipt was uploaded.
- Each employee's payment is tracked individually, even when displayed in a site-level queue.
- Duplicate references and mismatched amounts/recipients are flagged for review.
- Unpaid and unresolved employees remain visible until resolved; payroll cannot be silently closed with unresolved payments.
- SMS payslips are queued only after verified payment and are protected against duplicate sends.
- All role checks are enforced server-side, not only by hiding buttons in the UI.
- The interface clearly distinguishes recorded evidence, manual verification, and genuine provider-confirmed transactions.
- The PDF is a specification only; no source code, GitHub repository, or live deployment is changed by this document.

Important limitation: This method records and verifies payments made in the Site Head's GCash app. It is not an automated GCash API integration. Any future API-based payout must use an officially approved provider integration and must be validated separately before being described as automated.

Document status: implementation specification • Not evidence that the ERP has already been changed.
